informal discussions in 1977 among a number of scientists associated with solar and interplanetary physics revealed a need for a dialogue between the two often divergent groups it was clear that the latter group was dependent essentially on the sun for its raison d etre on the other hand it was also clear that the former group could benefit in its search for insight vis a vis solar activity by looking beyond the shell of the inner corona needless to add that the combined solar interplanetary topic is relevant to astrophysics when one considers stellar winds and binary star flows it was felt there fore that a symposium was essential to bring together for the first time leading solar and interplanetary physicists from the interna tional community to discuss and record herein their own research the fundamental physical processes underlying our own capricious star s activity can be understood only by the coupling of solar and interplanetary topics in an intimate observational and theoretical structure this book intended for active research scientists and advanced graduate students is an important step in this direction the background of solar and interplanetary dynamics is provided in part i the life history of coronal structures and fields and part ii coronal and interplanetary responses to long time scale phenomena

this volume contains a selection of the papers presented at the fourth symposium on numerical and physical aspects of aerodynamic flows which was held at the california state university long beach from 16 19 january 1989 it includes the stewartson memorial lecture of professor j h whitelaw and is divided into three parts the first is a collection of papers that describe the status of current technology in two and three dimensional steady flows the second deals with two and three dimensional unsteady flows and the papers in the third address stability and transition each of the three parts begins with an overview of current research as described in the following chapters the individual papers are edited versions of the selected papers originally submitted to the symposium four years have passed since the third symposium and certain trends be come clear if one compares the papers contained in this volume with those of previous volumes there are more three than two dimensional problems consid ered in part 1 and the latter address more difficult problems than in the past for example the extension to higher angles of attack to transonic flow to leading edge ice accretion and to thick hydrofoils the large number of papers in the first part reflects the emphasis of current research and development and the needs of industry
